

Module 01: Fundamentals of Computing

Intro to Computer Science 1 - C++
Professor Scott Frees

What do computers do?

Computers don't actually *do* much...

- Add/Subtract/Multiply/Divide numbers
- Remember numbers

Everything else is just a combination of these....
billions of them... each second....

Numbers

We think of numbers with a base of 10

- Each digit can be one of 10 different values
- Why?

Computers don't have fingers...

Computers are built of electronic circuitry

At the lowest level, they consist of transistors, small circuits that can control if electricity flows through them or not: **on and off.**

Instead of 10 states, a computer works with 2 states per digit: 0 and 1.... otherwise known as binary numbers.

Binary Numbers

0000
0001
0010
0011
0100
0101
0110
0111
1000
1001
1010

0
1
2
3
4
5
6
7
8
9
10

4-Bits: 0 - 15

8-Bits: 0 - 255

16-Bits: 0 - 65,535

32-Bits: 0 - 4,294,967,295

64-Bits: 0 - $1.84467441 \times 10^{19}$

Less compact, but just as expressive!

Binary numbers - uses

A single “bit” is either **1** or **0**.

On or **Off**

True and **False**

Boolean algebra works with true/false

| NOT | A | OUT |
|-----|---|-----|
| | 0 | 1 |
| | 1 | 0 |

| AND | A | B | OUT |
|-----|---|---|-----|
| | 0 | 0 | 0 |
| | 0 | 1 | 0 |
| | 1 | 0 | 0 |
| | 1 | 1 | 1 |

| XOR | A | B | OUT |
|-----|---|---|-----|
| | 0 | 0 | 0 |
| | 0 | 1 | 1 |
| | 1 | 0 | 1 |
| | 1 | 1 | 0 |

| OR | A | B | OUT |
|----|---|---|-----|
| | 0 | 0 | 0 |
| | 0 | 1 | 1 |
| | 1 | 0 | 1 |
| | 1 | 1 | 1 |

Logic Gates

Boolean operations can be implemented *in hardware circuits (20-30 transistors)*

AND

OR

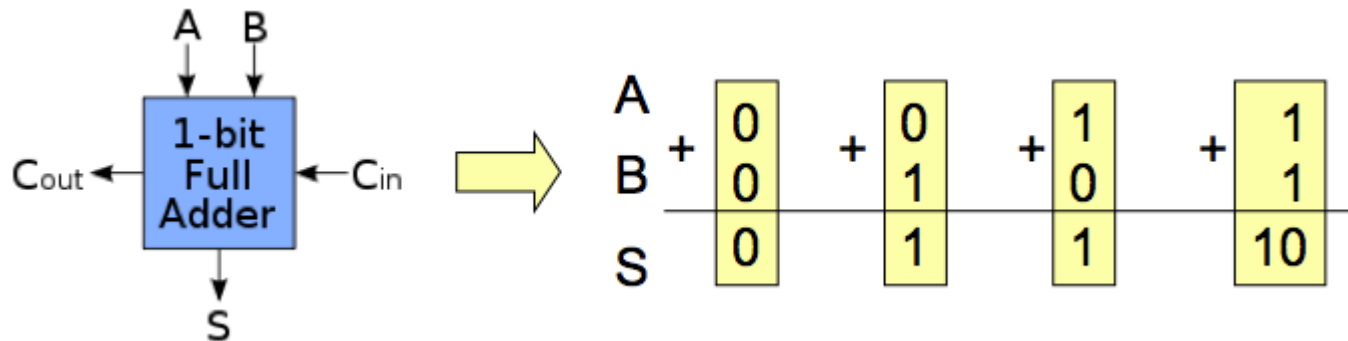

NOT

Arithmetic

Gates are “boxes” containing transistors
They *implement* boolean logic

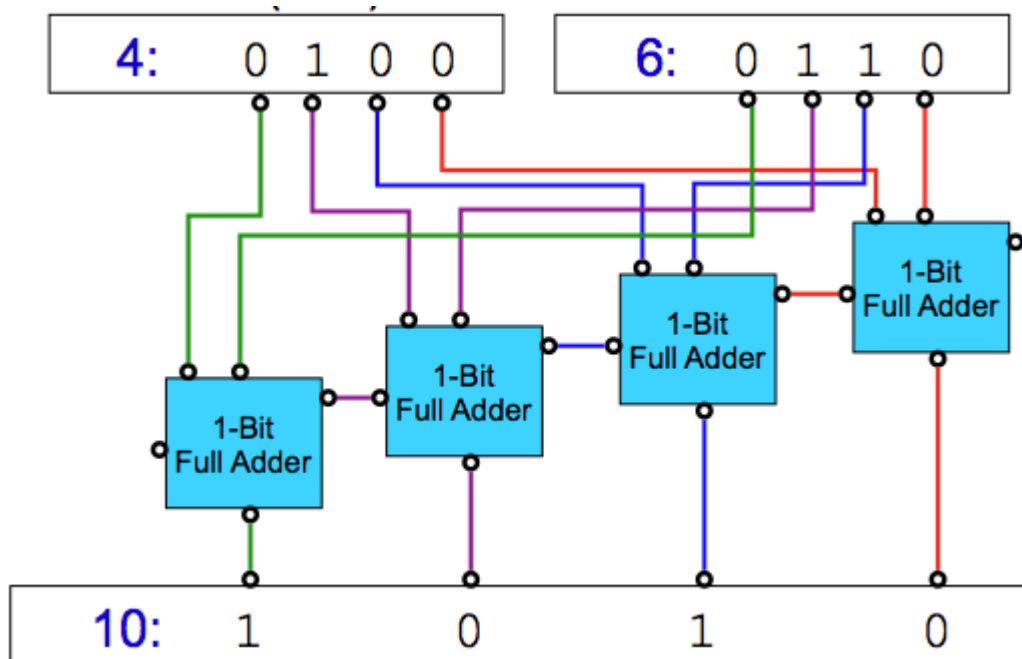

Arithmetic units are “boxes” containing gates

Arithmetic - Addition (1 bit)

Arithmetic - Addition - 4-bit

Timing: The left most-bits need to wait until the carry from the right bits is through the circuit

On a 64-bit machine, its the same design - just more!

Remembering Numbers

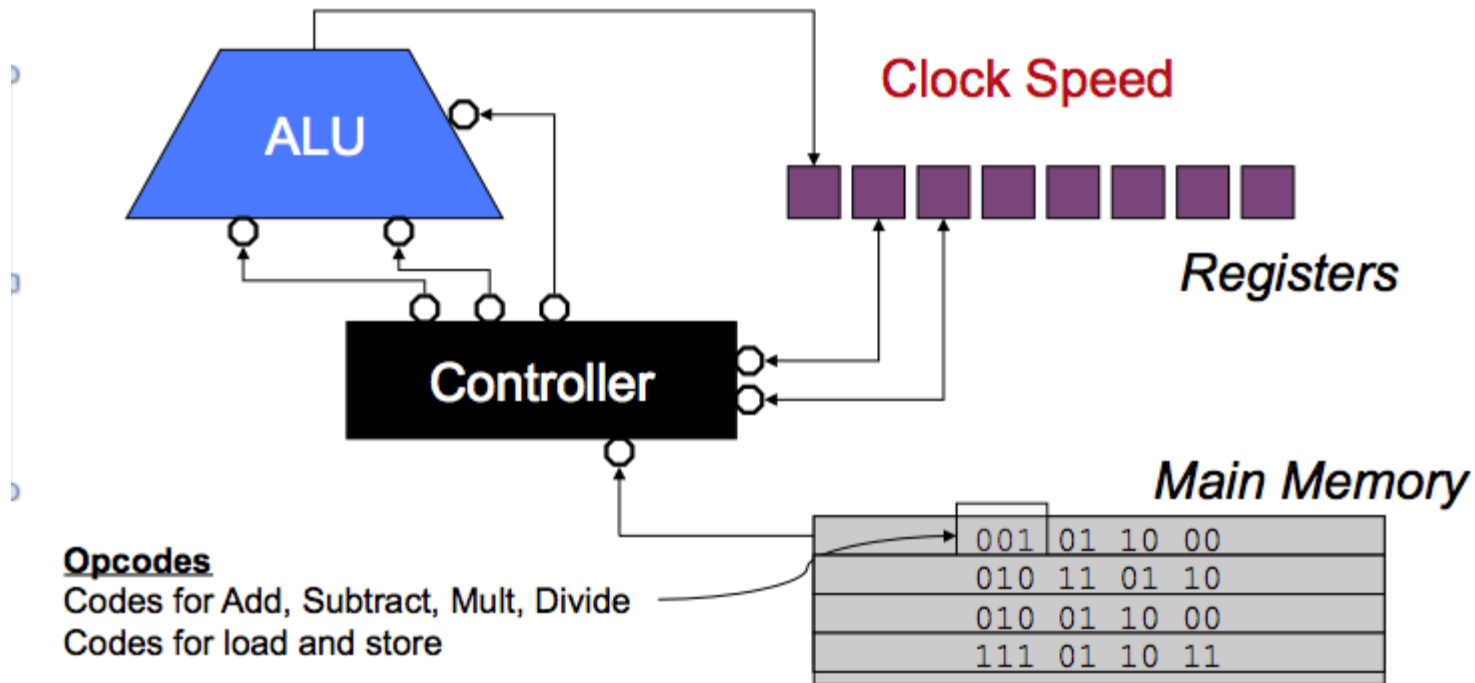

Inputs and outputs must be “held” in memory so they can be used in operations

Special electronic components can be toggled from “on” and “off” - called *flip-flops*

The circuit requires power though... so the machine needs to stay on!

The Central Processing Unit

Clock speed is governed by the time it takes for electricity to flow through the entire systems

Output

A computer screen is divided into a grid

Each grid point is a *pixel*

To output anything (shapes, text, etc.)

- Determine where you want to color the screen (pixel number)
- Encode color to a number
- Store the number in a special place in memory (frame buffer)

Encoding Color

- Colors are specified by a series of bits
- The variation in color is controlled by how many bits you use to represent color

| | |
|---|----------|
|  | 0: Black |
|  | 1: White |

24 bits gives you enough to represent all the colors the human eye can detect...

| | |
|---|--------------|
|  | 000: Black |
|  | 001: Blue |
|  | 010: Green |
|  | 011: Cyan |
|  | 100: Red |
|  | 101: Magenta |
|  | 110: Yellow |
|  | 111: White |

Text - input and output

- The keyboard simply maps keys to numbers
- The computer maps numbers back to characters to draw (pixels!)

| PRINTABLE CHARACTERS | | | | | | | | |
|----------------------|------|-----------|-----|------|-----------|-----|------|-----------|
| DEC | HEX | CHARACTER | DEC | HEX | CHARACTER | DEC | HEX | CHARACTER |
| 32 | 0x20 | <SPACE> | 64 | 0x40 | @ | 96 | 0x60 | ` |
| 33 | 0x21 | ! | 65 | 0x41 | A | 97 | 0x61 | a |
| 34 | 0x22 | " | 66 | 0x42 | B | 98 | 0x62 | b |
| 35 | 0x23 | # | 67 | 0x43 | C | 99 | 0x63 | c |
| 36 | 0x24 | \$ | 68 | 0x44 | D | 100 | 0x64 | d |
| 37 | 0x25 | % | 69 | 0x45 | E | 101 | 0x65 | e |
| 38 | 0x26 | & | 70 | 0x46 | F | 102 | 0x66 | f |
| 39 | 0x27 | ' | 71 | 0x47 | G | 103 | 0x67 | g |
| 40 | 0x28 | (| 72 | 0x48 | H | 104 | 0x68 | h |
| 41 | 0x29 |) | 73 | 0x49 | I | 105 | 0x69 | i |
| 42 | 0x2A | * | 74 | 0x4A | J | 106 | 0x6A | j |
| 43 | 0x2B | + | 75 | 0x4B | K | 107 | 0x6B | k |
| 44 | 0x2C | , | 76 | 0x4C | L | 108 | 0x6C | l |
| 45 | 0x2D | - | 77 | 0x4D | M | 109 | 0x6D | m |
| 46 | 0x2E | . | 78 | 0x4E | N | 110 | 0x6E | n |

Binary Programs

In the end - *instructions* are just a series of bits - where each number corresponds to an operation

- Add/Subtract, Multiply/Divide
- Load and Store number from memory location

Our job as **programmers** is to tell the computer what to **do** - using only these basic operations!

Thankfully, we don't need to program in binary, or these simple terms - we have **higher level languages** that we can use.

Computers are not smart

If you remember nothing else from this lecture -
remember this!

Computer do **exactly** what you tell them to do

Never more...

Never less...

So don't get angry :)
